ATS-3100 RTS for Mission-Critical Radio Test
Flexibility to Test Legacy and Modern Radios on One Platform

Maximum Return on Investment
Extend the life of your legacy radios while simultaneously supporting modern radio technology, both airborne and ground, with the ATS-3100 Radio Test Set (RTS) - the complete solution for military and commercial radio test.

The ATS-3100 RTS is a PXIe-based, benchtop, software-defined platform, handling the work of multiple instruments to verify the functionality of both legacy radios (e.g. SINCGARS) and modern wideband radios (e.g. AN/PRC-117G) from virtually any Original Equipment Manufacturer (OEM).

Developed with the user in mind, the ATS-3100 RTS and the portable, CTS-6010 share a common software framework and test executive. This synergy from depot to field allows the user to focus on the task at hand and increase overall operational efficiency.

Designed for Maintainability and Expandability
The ATS-3100 RTS is built with modular system architecture which features design for maintainability and the capability for future expansion.

Due to its unique design, it boasts exceptional Mean Time to Repair (MTTR) with easy, in-and-out access to the two primary Line-Replaceable Units (LRUs) and rapid, automated calibration.

Ideal for use for:
- GRM-122 plug and play replacement
- Legacy and modern radios
- Airborne and ground
- Multiple OEMs
- Military and commercial radio test

KEY BENEFITS
- Complete solution - test legacy and modern radios, both airborne and ground, from multiple OEMs
- Maximum return on investment - extend the life of your legacy radios with headroom to test modern radios
- GRM-122 replacement - plug and play support for GRM-122 TPSs and cable sets
- Synergy from depot to field - common test executive and software framework
- Reduced downtime - minimum MTTR and rapid automated calibration
- Flexibility to customize - expandable PXIe-based platform
- Long-term partner - nearly 60 years of expertise in test and integration solutions

"This is what we see as the future of radio test." - Astronics Customer
In addition, the design of this platform provides room for future expansion, both in hardware and software, so you have headroom for growth as technologies evolve and your needs change.

**Keep Equipment Deployed.**
Plagued by costly No-Fault-Found (NFF) returns taking your valuable assets out of service for months? The ATS-3100 RTS has built-in capability to perform a wide range of tests to identify failure root cause, allowing you the capability to repair in-house without buying additional equipment or simply “doing without”.

**Features Customized for You.**
The ATS-3100 RTS has a single, low-cost PXIe module which contains the entire Radio Frequency (RF), Analog, and Digital Sub-systems performing complex measurement and stimulus signal processing functions. Additional features include:

- Easy access to the two, primary LRUs for repair
- Frequency range from 1 MHz to 6 GHz
- Wide modulation bandwidth up to 200 MHz
- Intuitive Graphical User Interface (GUI) and Test Executive
- Low-cost, two-hour automated calibration and verification
- Reconfigurable and expandable
- PXIe-based platform

**Your Long-Term Partner.**
With nearly 60 years of expertise in the test field and a proven track record of providing leading-edge Radio Test Solutions, Astronics Test Systems knows what it takes to support a product for decades. Radio tester design and Test Program Set (TPS) development are core competencies of Astronics Test Systems which solidify its commitment to custom, integrated solutions for years to come.
